Introduction (1/2)

People Are Warming Up To Self-Driving Cars

Percentage of consumers who think fully self-driving vehicles will not be safe (2017 vs. 2018)*

1.25 million people die in car crashes each year

There are 30k people die each year due to cancer as a result of car air pollution

Capmas has reported that In 2016 there are 14700 accidents occurred in Egypt

There are 1.5 million accidents occur each year, autonomous vehicle could save half million lives each year

Problem Statement

Self Driving cars are still not totally legal in lots of countries as they are still not safe enough to be relied on in public.

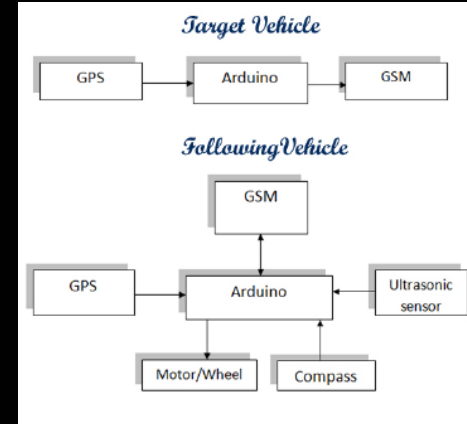

Related work

Sensors used (GPS, GSM, US, Compass).

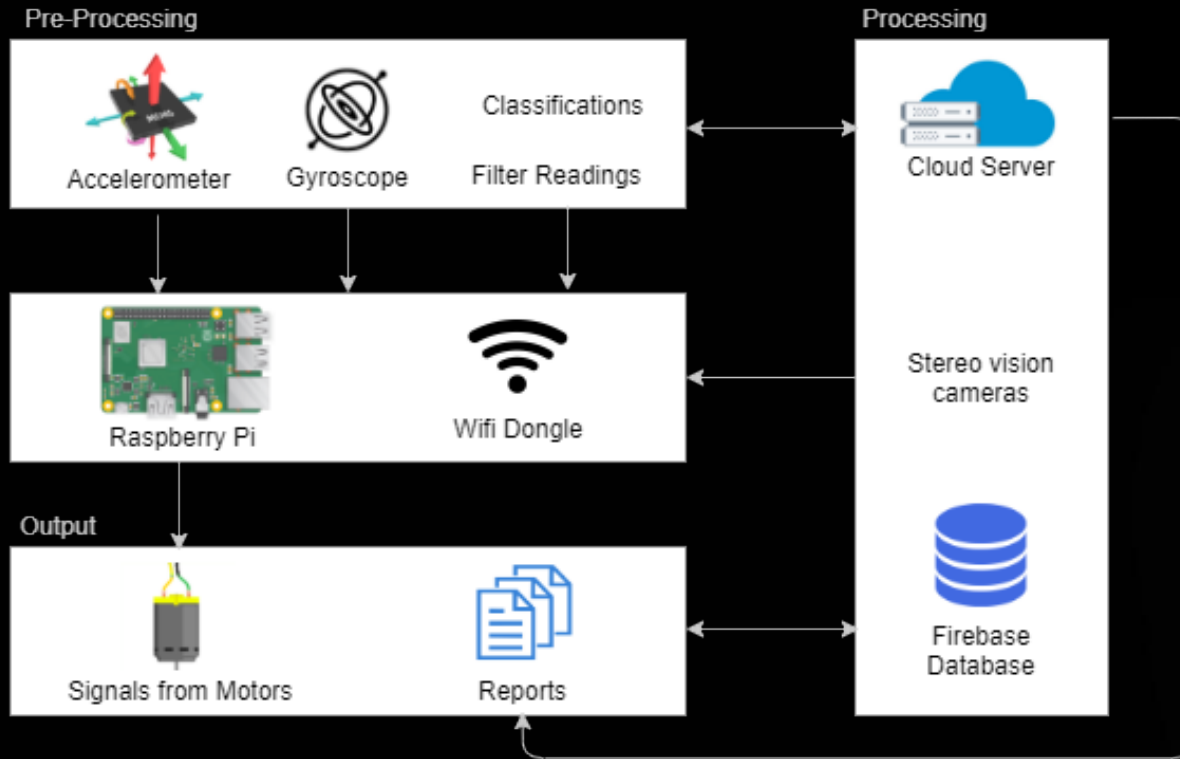

Modified the concept of google car.

Aims of this system

- 1) Make driver more relaxed in traffic jam.
- 2) Create automated vehicle whose destination is dynamic.

System Overview

Methodology(1 / 3)

Machine learning method (SVM)

Accuracy **95.36% - 98.61%**

Table1: Anomalies detection accuracy with different algorithms on our dataset

Classification algorithm	NaiveBayes	SVM	KNN	Decision Tree
Accuracy	95.8%	98.6%	96.5%	97.9%

Table2: Anomalies detection accuracy with different algorithms on a real dataset

Classification algorithm	NaiveBayes	SVM	KNN	Decision Tree
Accuracy	55.0%	72.1%	66.7%	68.1%

Methodology(2 / 3)

Advantages:

- It gets high accuracy.
- It is faster in video frames recognition.
- It detects the right lane so that the car takes the right decision and send the signals to the Arduino.

Methodology(3 / 3)

Disparity Pre-processing phase:

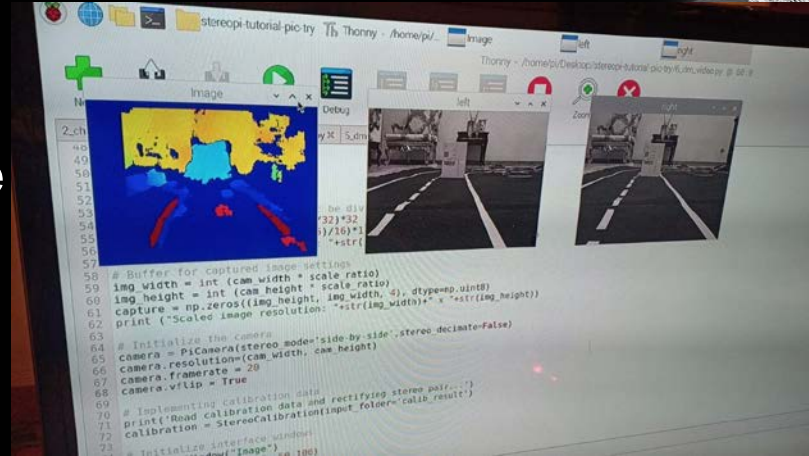

- ✓ Fix the cameras in a certain way.
- ✓ Collect dataset of chessboard for the calibration.
- ✓ Apply calibration.
- ✓ Apply tuning.

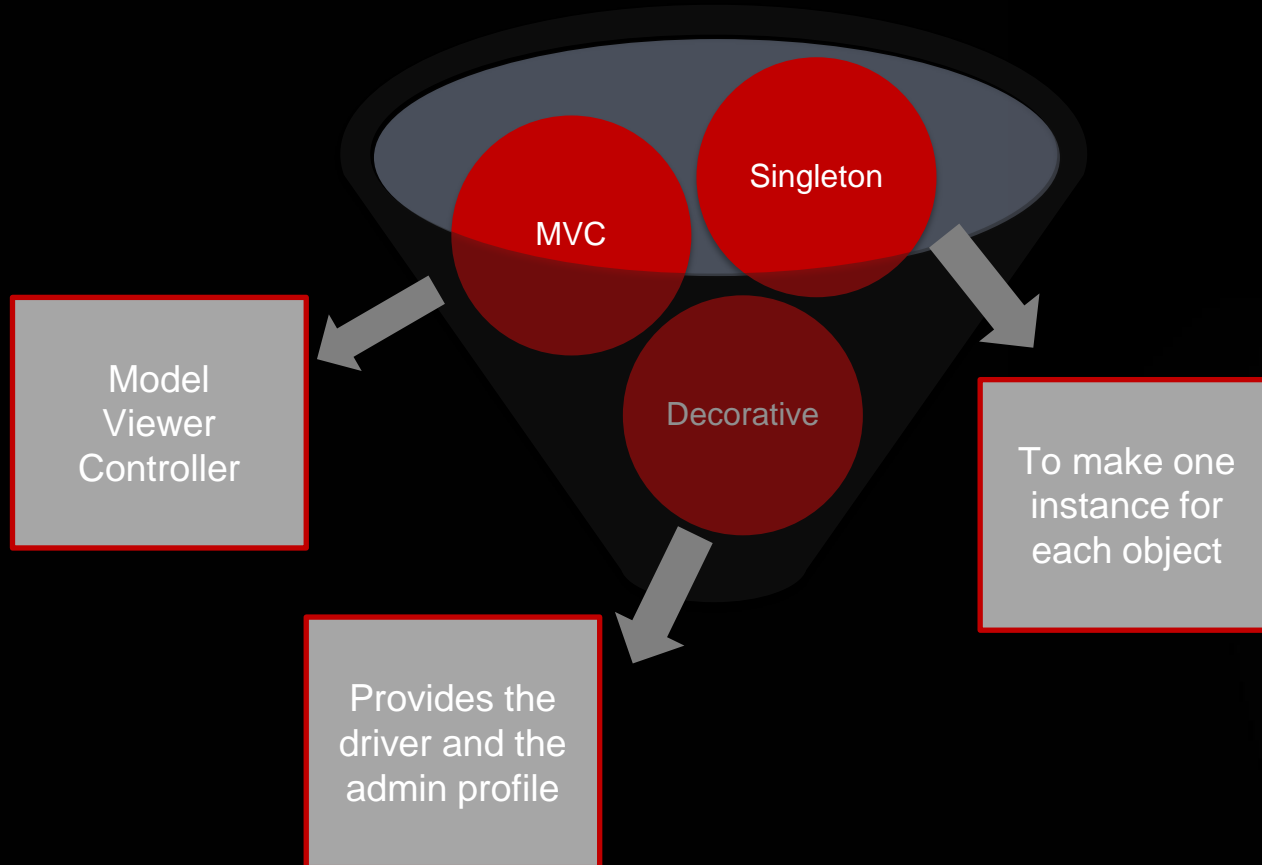

Methodology(3 / 3)

Disparity Processing phase:

- ✓ Show Disparity Map.
- ✓ Extract the histogram from the disparity map.
- ✓ Applying threshold.
- ✓ Take decision according to the
- ✓ density frequency repetition.

ELSEVIER

Car Environment

Car Environment

Car Hardware

Techniques and tools used

Plan for final project

- Add wifi dongle to transfer data from the car to mobile application.
- Run the project subsystems in parallel.

Future Work

- Apply the prototype on a real life-time car.
- Add GPS to save the location of the anomalies.
- Recognizing road signs and traffic lights

Demo

Distance Measurement

Project Structure:

- app
 - manifests
 - java
 - com.example.carapp
 - Controller
 - Database
 - Entites
 - Model
 - CarModel
 - ReportsModel
 - UserModel
 - UsertypeModel
 - View
 - AddDriver
 - AdminActivity
 - adminProfile
 - baseProfile
