

# **Automatic Analysis of Fish Farm Environment**

- ❖ Ahmed Waled
- ❖ Hadeer Medhat
- ❖ Mariam Esmail
- ❖ Kareem Osama

❖ Supervised By: DR.Taraggy M Ghani  
Eng.Radwa Samy

# Introduction 1/4

Fish farm environment strongly affects fish behavior and health.  
An uncontrolled environment may cause fish mortality.  
The proposed system serves this field by analyzing fish farm environment and is presented in three consequent stages.

# Introduction 2/4

## First Stage

The system contains interface circuit that connects reality and computer recognition systems. The interface circuit consists of three main parts.

1) Raspberry Pi 3

2) Sensors

Temperature

PH

3) Camera

# Introduction 3/4

## Second Stage

### Fish Disease Classification

Our system classify three different types of fish diseases

EUS

ICH

COLUMNARIS

### Fish Tracking

Our system tracks fish movements to help in expectation of fish behavior

# Introduction 4/4

## Third Stage

The system sends a notification through an android application to inform users of any improper farm conditions and any detected infections.

# Related Work I

**Approach**

Automatically detects or diagnoses the EUS diseased fish

**Algorithm**

Canny's edge detection, Fast algorithm, PCA, Neural Network

**Result**

86% on images taken from sources as NGRF, Lucknow and CIFRI

# Related Work II

**Approach**

Detects or diagnoses the EUS diseased fish.

**Algorithm**

PCA, K-Means Clustering and HSV

**Result**

90% on images collected from the different part of the Barak Valley, Assam

# Related Work III

**Approach**

Extract pathogen area of infected fish and send notification about diagnosed disease and to the fish farmers

**Algorithm**

3x3 mean filter, edge sharpening filter, Morphological erosion and dilation operations, Polar and geometric feature, PCA

**Result**

90% on images collected from 8 different aquaculture farms in the Wando, Jindo, and Yosu areas of Korea

# Problem Statement

- ❖ Building a system that **achieves higher accuracy** than manual checking.
- ❖ **Prevent** fish diseases from spreading in fish farms.
- ❖ **Solve** problem that experts may face such as to Fast fish movement and unclear vision.

# Challenges

❖ There is no published public dataset

- Fish4knowledge only and the site is for sale.

❖ Concerns on diagnosing one disease at time

❖ Inaccurate Segmentation (As Color Segmentation).

❖ Color segmentation approaches

- Specify 1 odd color

❖ Limited human vision due to earthen ponds

❖ A lot of measurements should be controlled

❖ Fish Fast Movement

# Dataset 1/2

Our data-set includes images of fish with the three types of fish diseases. Our data-set were collected from different internet resources. We also collected some images from “Africa Aquaculture Research and Training Center (AARTC), Abbassi, Egypt”

Prof. Dr. Ayman Anwar Ammar  
Central Laboratory for Aquaculture Research (CLAR)  
Egypt

# Dataset 2/2

However, the number of images collected is not large enough to train the system. Therefore, we applied data augmentation to increase our samples because the collected images are not sufficient for training purpose.

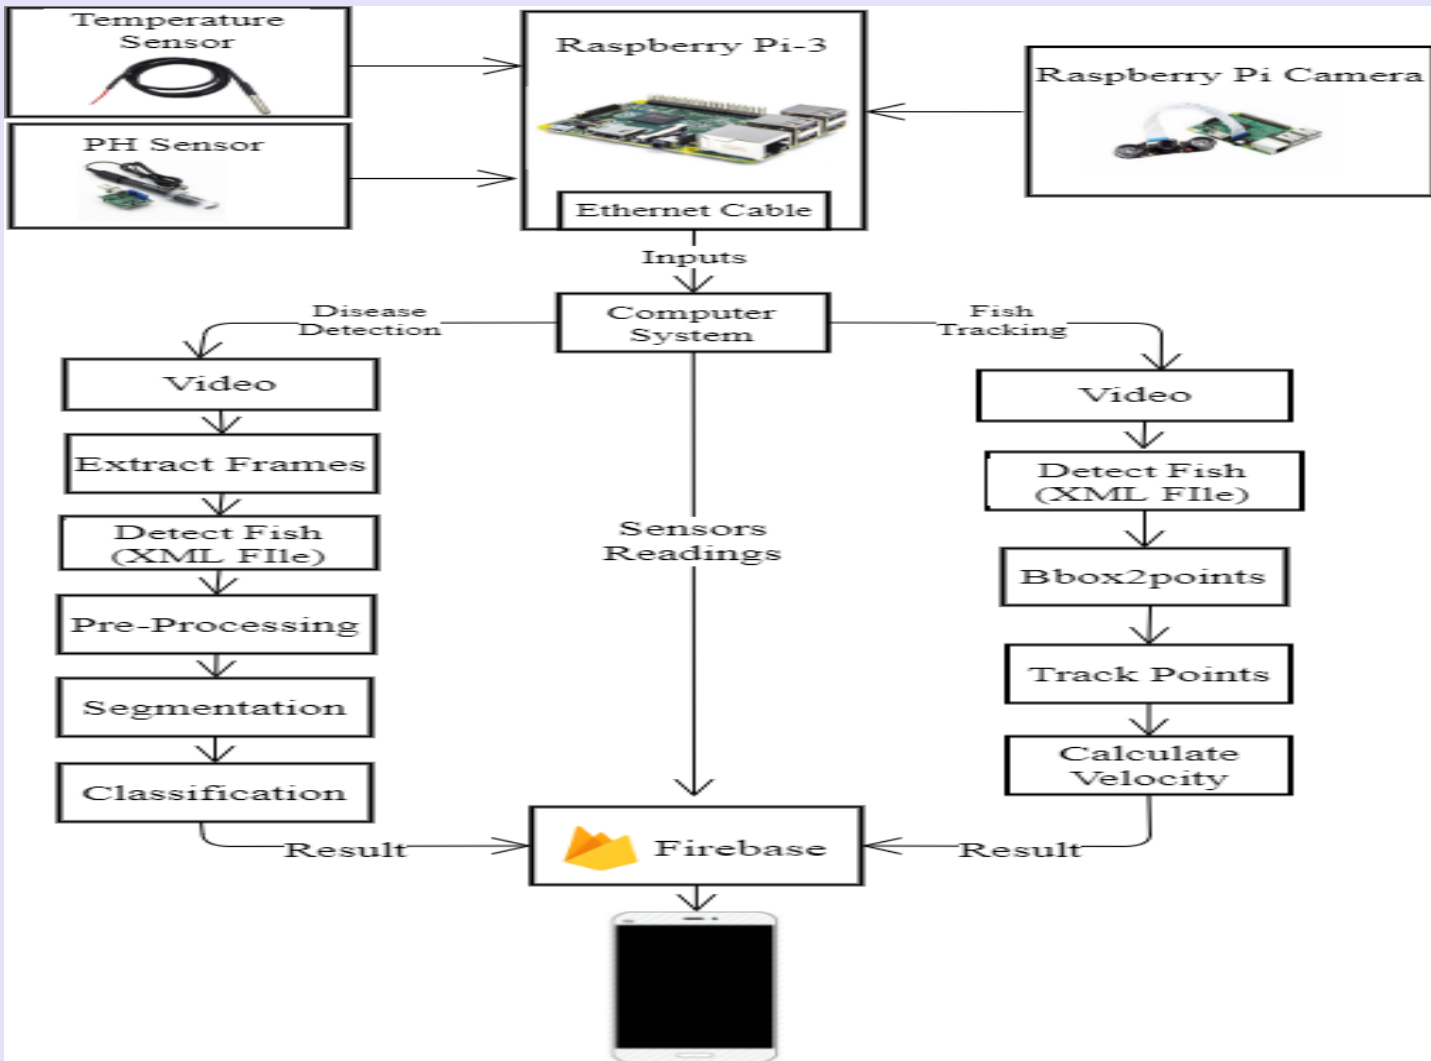

# Motivation

- In Egypt, The intensive aquaculture farming has grown increasingly,
- especially in the deserts of northern Sinai. Fish farms are distributed through the
- Nile Delta region and concentrated mainly in the Northern lakes

# System Overview

# Algorithms used

## ❖ Segmentation:

- Gaussian Distribution

## ❖ Classification:

- Different architectures of convolutional neural network

## ❖ Tracking

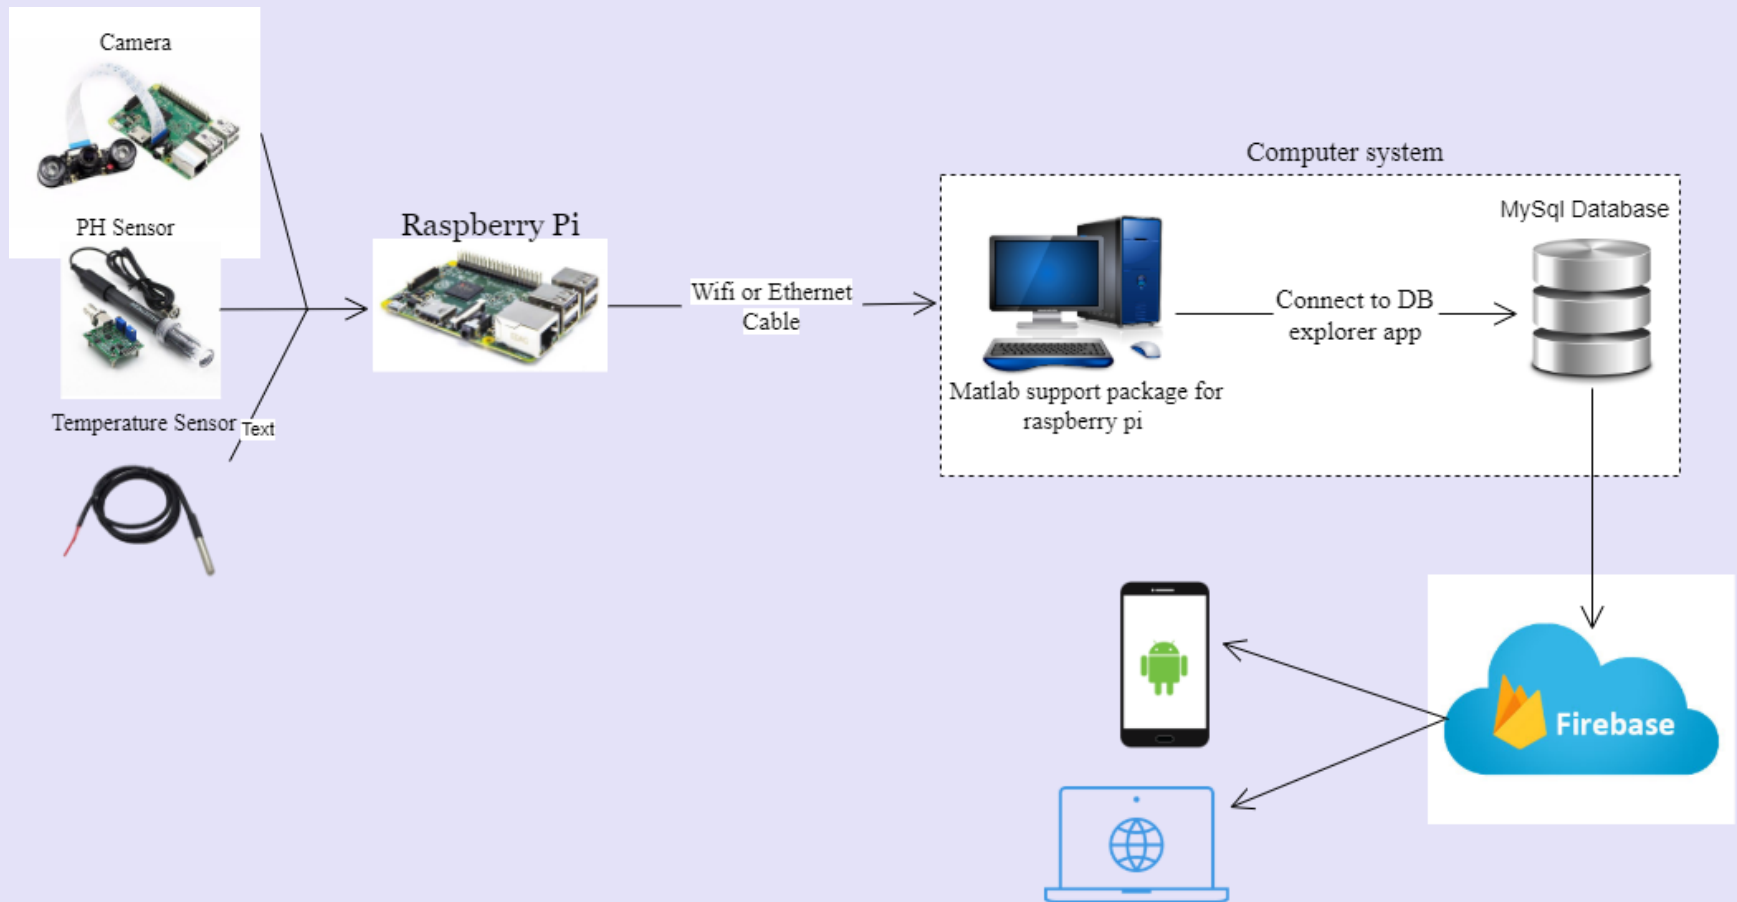

- Vision Point Tracking using Kanade-Lucas-Tomasi (KLT) feature-tracking algorithm

# Raspberry Pi connection with sensors

Raspberry Pi

# Hardware-circuit

# Pre-processing

During the pre-processing phase, Three different color spaces were applied;  
RGB, YCbCr, XYZ and LAB.

RGB

XYZ

YCBCR

# Segmentation

For segmentation, we built a Gaussian distribution in three different color space, Building an effective Gaussian distribution requires a suitable computed means and covariances.

# CNN Classification

| Model            | Versions | Layers     | Activation function | Input size | Convolution kernel size  | Innovative point  | Applications   |
|------------------|----------|------------|---------------------|------------|--|---|--|
| ResNet ??        | 18       | 18 layers  | ReLU                | 224x224x3  | ResNet initial convolution: 7x7, Resnet 50 and 101: 1x1, 3x3 and 1x1, ResNet 18: 3x3 | ResNet overcomes degradation and vanishing gradient problems residual blocks that increases the number of hidden layers. The core idea of ResNet is introducing "identity shortcut connection" that skips one or more layers  | ImageNet 2012 dataset ?? and Automatic Spoofing Detection [1]                                  |
| VGG [2]          | 16       | 16 layers  | ReLU non-linear     | 224x224x3  | VGG: 3x3   | This network uses only 3x3 convolutional layers stacked on top of each other in increasing depth. VGG makes improvement over AlexNet by replacing large kernel-sized  | ImageNet (ILSVRC-2012) and Classifying Cooking Object's State [3]                              |
| SqueezeNet [4]   | 19       | 19 layers  | ReLU                | 227x227x3  | SqueezeNet: 1x1 and 3x3  | SqueezeNet goal was to create small neural network with fewer parameters. It was able to achieve a 50X reduction in model size compared to AlexNet. SqueezeNet has advantage of fire module, which uses less filters to decrease number of parameters   | ImageNet dataset, fine-grained object recognition [5] and Generic Visual Recognition [6]       |
| DenseNet [7]     | 201      | 201 layers | ReLU                | 224x224x3  | DenseNet: 7x7  | In DenseNet, the feature-maps of all preceding layers are used as inputs, and its own feature-maps are used as inputs into all subsequent layers. DenseNet alleviate the vanishing-gradient problem and reduce the number of parameters   | ImageNet (ILSVRC-2012) [8] and optical flow [1]  |
| AlexNet [9]      |          | 8 layers   | ReLU non-linear     | 227x227x3  | Alexnet: 11x11, 5x5 and 1x1  | AlexNet has large number of filters to perform the convolution operation of sizes 11x11, 5x5 and 3x3  | ImageNet(ILSVRC-2010) and high Spatial Resolution Remote Sensing [10]                          |
| GoogleNet [11]   |          | 22 layers  | ReLU                | 224x224x3  | GoogleNet: 5X5, 3X3 and 1X1  | GoogleNet increases the depth of the network and gain a higher performance level. It is based on the concept of the inception module, it is the collection of convolution and pooling operation performed in a parallel manner so that features can be extracted using different scales                                   | ImageNet(ILSVRC14) and High performance offline handwritten Chinese character recognition [12] |
| Mobilenetv2 [13] | 2        | 54 layers  | ReLU6               | 224x224x3  | Mobilenetv2: 1x1, 3x3  | Mobilenetv2 improves the performance of mobile models on multiple tasks. Mobilenetv2 is based on an inverted residual structure   | ImageNet, Face Attribute Detection [14]  |
| Xception [15]    |          | 71 layers  | ReLU                | 299x299x3  | Xception: 1x1,3x3  | Xception involves Depthwise Separable Convolutions, it is supposed to be more efficient than classical convolution in terms of computation time. Xception relies on Shortcuts between Convolution blocks  | ImageNet dataset [16], Audio Event Detection and Tagging [17]                                  |
| Inceptionv3 [18] | 3        | 48 layers  | ReLU                | 299x299x3  | Inceptionv3: 3x3   | In inceptionv3, computational efficiency and fewer parameters are realized  | ImageNet(ILSVRC 2012) and flower classification [19]   |
| ShuffleNet [20]  |          |            | ReLU                | 224x224x3  | Shufflenet: 1x1,3x3  | Shufflenet aim to explore a highly efficient architecture specially designed for limited computing ranges. Shufflenet allows more feature map channels and it is especially critical to the performance of very small networks. ShuffleNet achieves 13x actual speedup over AlexNet while maintaining comparable accuracy | ImageNet, Mobile devices [21]  |

# Object Detection

- ❖ In our proposed approach, we applied vision.CascadeObjectDetector System object, It detects objects in images by sliding window over the image. Then uses a cascade classifier to decide whether the window contains the object of interest.

# Tracking

- ❖ Benchmark Trajectories for Multi-Object
- ❖ Tracking Histogram-based object
- ❖ Tracking vision. Point Tracker using KLT Algorithm

# Segmentation Experiments 1/2

- For segmentation, we build the Gaussian model on XYZ, LAB and YCBCR color spaces. We found that EUS achieved good results in LAB color space, while ICH achieved good results in YCBCR color space and Columnaris in XYZ.

Table 5.2: Segmentation Experiment on different color spaces

| Color Spaces | EUS   | ICH   | Columnaris |
|--------------|-------|-------|------------|
| XYZ          | 51.9% | 74.5% | 85.8%      |
| YCBCR        | 60.1% | 79.8% | 30.3%      |
| LAB          | 79.7% | 64.9% | 16.1%      |

| ResNet101        | RGB-0.001                | 92.3567%         | 80%               | 16min,46sec  |

# Object Detection Experiments

## HOG Feature

HOG features are often used to detect objects such as people and cars. They are useful for capturing the overall shape of an object.

## Haar Feature

Haar features are often used to detect faces because they work well for representing fine-scale textures.

In our experiment, HOG feature outperformed haar feature and it achieved good accuracy when applying 'MinSize' and 'Threshold' to enhance the detection to be more accurate

# Video Trajectory Experiments

## Matrix Creation

| matrix2      |            |          |   |

# Track Segmentation

The image displays the MATLAB R2019a environment. The main window shows a script named 'Videodetect.m' with the following code:

```
19 channel1Max = 149.000;
20
21 % Define thresholds for channel 2 based on histogram settings
22 channel2Min = 0.000;
23 channel2Max = 127.000;
24
25 % Define thresholds for channel 3 based on histogram settings
26 channel3Min = 85.000;
27 channel3Max = 126.000;
28
29
30
31 % Create mask based on chosen histogram thresholds
32 sliderBW = (I(:,:,1) >= channel1Min) & (I(:,:,1) <= channel1Max) & ...
33 (I(:,:,2) >= channel2Min) & (I(:,:,2) <= channel2Max) & ...
34 (I(:,:,3) >= channel3Min) & (I(:,:,3) <= channel3Max);
35 BW = sliderBW;
36
37 % Initialize output masked image based on input image.
38 maskedRGBImage = videoFrame;
39
40 % Set background pixels where BW is false to zero.
41 maskedRGBImage(repmat(~BW, [1 1 3])) = 0;
42 bbox = faceDetector(maskedRGBImage);
43 videoFrame = insertShape(videoFrame, 'Rectangle', bbox);
44
45 % Display video frame to screen
46 depVideoPlayer(BW);
47
48
49 % Write frame to final video file
```

The Command Window on the left shows the execution results for each line of code:

| Line | Value         |
|------|---------------|
| 3    | 3 fish Detect |
| 1    | 1 fish Detect |
| 2    | 2 fish Detect |
| 2    | 2 fish Detect |
| 0    | 0 fish Detect |
| 1    | 1 fish Detect |
| 0    | 0 fish Detect |
| 1    | 1 fish Detect |
| 1    | 1 fish Detect |
| 2    | 2 fish Detect |
| 2    | 2 fish Detect |
| 3    | 3 fish Detect |
| 1    | 1 fish Detect |
| 1    | 1 fish Detect |
| 3    | 3 fish Detect |
| 2    | 2 fish Detect |
| 1    | 1 fish Detect |
| 1    | 1 fish Detect |
| 3    | 3 fish Detect |
| 2    | 2 fish Detect |
| 3    | 3 fish Detect |
| 3    | 3 fish Detect |
| 3    | 3 fish Detect |
| 4    | 4 fish Detect |
| 1    | 1 fish Detect |
| 2    | 2 fish Detect |
| 3    | 3 fish Detect |
| 3    | 3 fish Detect |
| 2    | 2 fish Detect |
| 1    | 1 fish Detect |

The Workspace on the left shows variables such as 'bbox', 'BW', 'channel1Max', 'channel1Min', 'channel2Max', 'channel2Min', 'channel3Max', 'channel3Min', 'depVideoPlay...', 'detectedImg', 'Detector', 'faceDetector', 'frame', 'gTruth', 'i', 'l', 'imageLabelin...', 'imDir', 'J', 'maskedRGBI...', 'myVideo', 'n', 'negativeFolder', 'negativeImag...', 'positiveInstan...', 'sliderBW', 'str', 'str\_n', 'videoFileRea...', 'videoFrame', and 'videoReader'.

# Final result

- In the tracking phase, Vision.pointTracker is applied by using the Kanade-Lucas-Tomasi (KLT) algorithm . The Estimate Geometric Transformation is then applied to determine the transformation between the point locations in the previous and current frames

# Fish Tracking Experiments

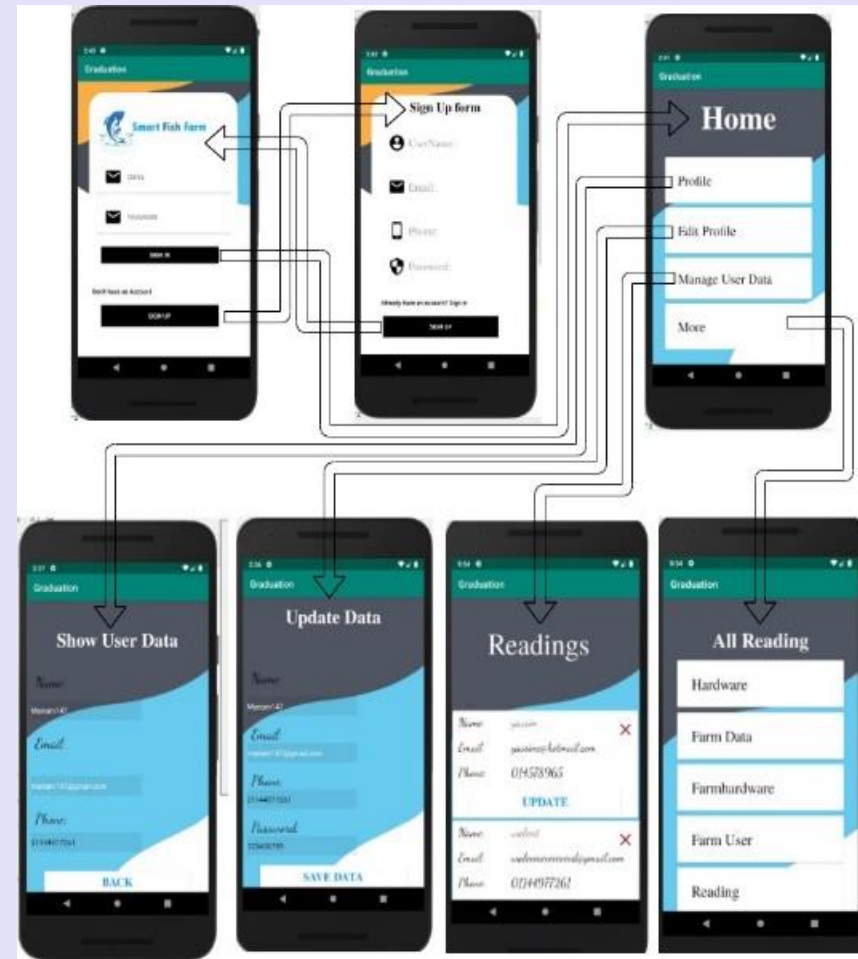

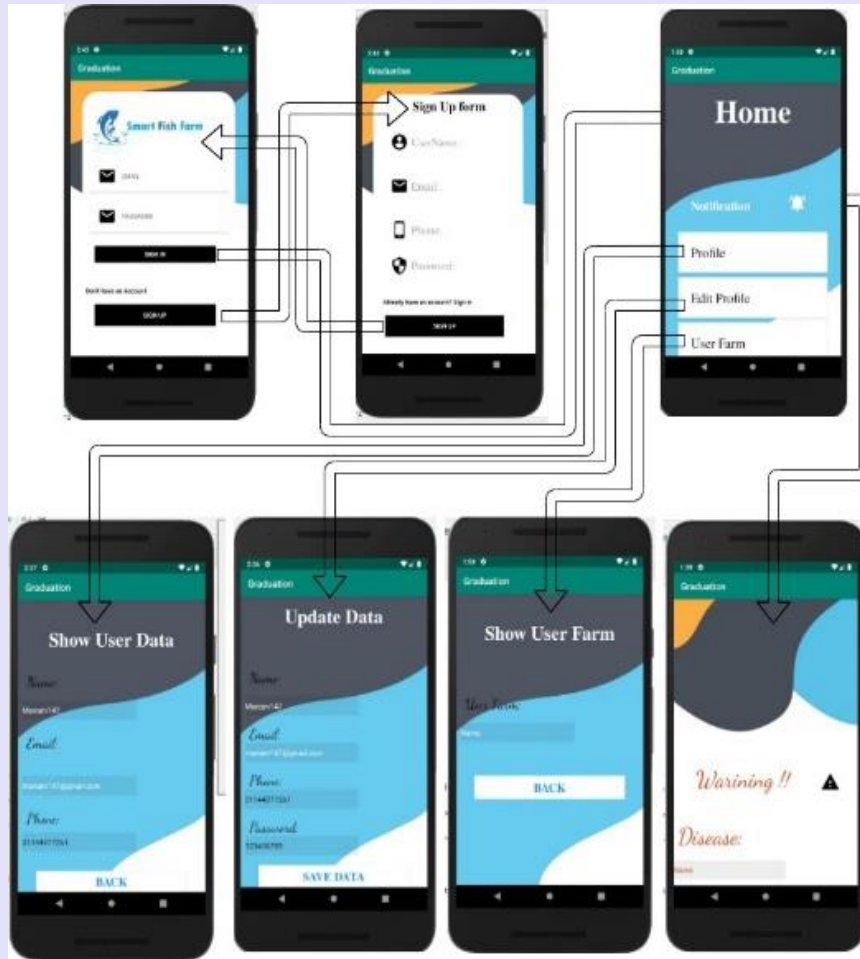

After applying fish tracking, fish velocity is then calculated to help in the expectation of fish behavior.

The velocity is calculated by multiplying the distance of centroids between previous frame and current frame.

This is done by getting the video frame rate (frame/second), the video scale (meter/pixel).

# Data Augmentation Demo

The screenshot shows the PyCharm IDE with a Python script named GP.py open. The script defines several functions for image augmentation using OpenCV. The functions are: scale\_image, translation\_image, rotate\_image, resize\_image, crop\_image, and padding\_image. The script also includes an import statement for cv2 and a main function that reads an image from a folder and applies the augmentation functions.

```
import cv2
Folder_name="image"
Extension=".png"
Folder_name="image"

def scale_image(image, fx, fy, i):
    image = cv2.resize(image, None, fx=fx, fy=fy, interpolation = cv2.INTER_CUBIC)
    cv2.imwrite(Folder_name+"/Scale-"+str(fx)+str(fy)+ str(i)+Extension, image)

def translation_image(image, x, y, i):
    rows, cols, c= image.shape
    M = np.float32([[1, 0, x], [0, 1, y]])
    image = cv2.warpAffine(image, M, (cols, rows))
    cv2.imwrite(Folder_name + "/Translation-" + str(x) + str(y)+ str(i) + Extension, image)

def rotate_image(image, deg, i):
    rows, cols, c = image.shape
    M = cv2.getRotationMatrix2D((cols/2,rows/2), deg, 1)
    image = cv2.warpAffine(image, M, (cols, rows))
    cv2.imwrite(Folder_name + "/Rotate-" + str(deg) +str(i)+Extension, image)

def resize_image(image, w, h, i):
    image=cv2.resize(image, (w, h))
    cv2.imwrite(Folder_name+"/Resize-"+str(w)+"*"+str(h)+str(i)+Extension, image)

#crop
def crop_image(image, y1, y2, x1, x2, i):
    image=image[y1:y2, x1:x2]
    cv2.imwrite(Folder_name+"/Crop-"+str(x1)+str(x2)+"*"+str(y1)+str(y2)+ str(i)+Extension, image)

def padding_image(image, topBorder, bottomBorder, leftBorder, rightBorder, i, color_of_border=[0,0,0]):
    image = cv2.copyMakeBorder(image, topBorder, bottomBorder, leftBorder,
    rightBorder, cv2.BORDER_CONSTANT, value=color_of_border)
    cv2.imwrite(Folder_name + "/add-" + str(topBorder) + str(bottomBorder) + "*" + str(leftBorder) + str(rightBorder)+ str(i) + Extension, image)

scale_image()
```
